

Adaptive Mail: A Flexible Email Client App

Project Based Experiential Learning Program

Adaptive Mail: A Flexible Email Client App

Adaptive Mail app is a sample project that demonstrates how to use the Android Compose UI toolkit to build a conversational UI. The app simulates a messaging interface, allowing the user to send and receive messages, and view a history of previous messages. It showcases some of the key features of the Compose UI toolkit, data management, and user interactions.

Architecture

Learning Outcomes:

By end of this project:

- You'll be able to work on Android studio and build an app.
- You'll be able to integrate the database accordingly.

Project Workflow:

- Users register into the application.
- After registration, user logins into the application.
- User enters into the main page
- User can View previously sent emails.
- User can give subject and email body to send email.

Tasks:

- 1.Required initial steps
- 2. Creating a new project.
- 3. Adding required dependencies.
- 4. Creating the database classes.
- 5. Building application UI and connecting to database.
- 6. Using AndroidManifest.xml
- 7. Running the application.

Task 1:

Required initial steps:

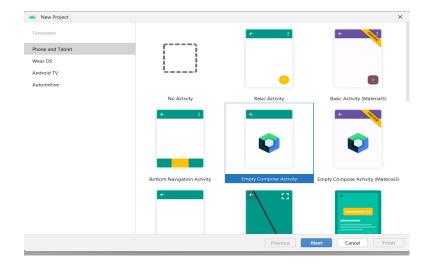

https://developer.android.com/studio/install

Task 2:

Creating a new project.

Step 1 : Android studio > File > New > New Project > Empty Compose Activity

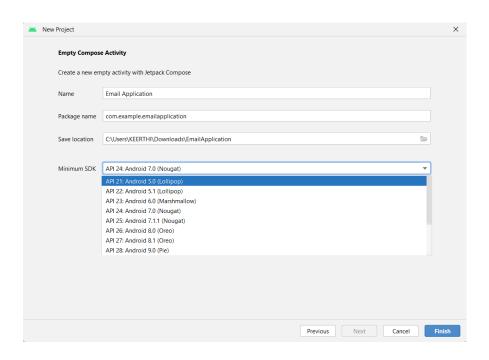

Step 2 : Click on Next button.

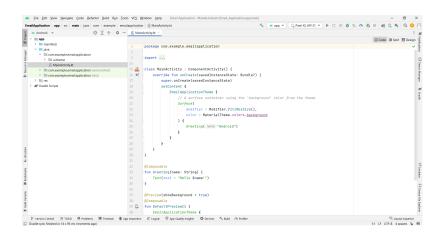

Step 3: Give name to the new project.

Step 4: Give the Minimum SDK value

Step 5 : Click Finish

Main activity file

Task 3:

Adding required dependencies.

Step 1 : Gradle scripts > build.gradle(Module :app)

Step 2 : Adding room dependencies. Add the below code in dependencies

```
// Adding Room dependencies
implementation 'androidx.room:room-common:2.5.0'
implementation 'androidx.room:room-ktx:2.5.0'
```

```
Android * O I + O - Whotopade (age)

Coate fine have dauged once last project yet. A project yet may be necessary for the DC to work property.

Synt Nov. Ignore through the project through any project yet may be necessary for the DC to work property.

If you make recommend through through the project project yet and project project yet and project project
```

Step 3: Click on Sync now

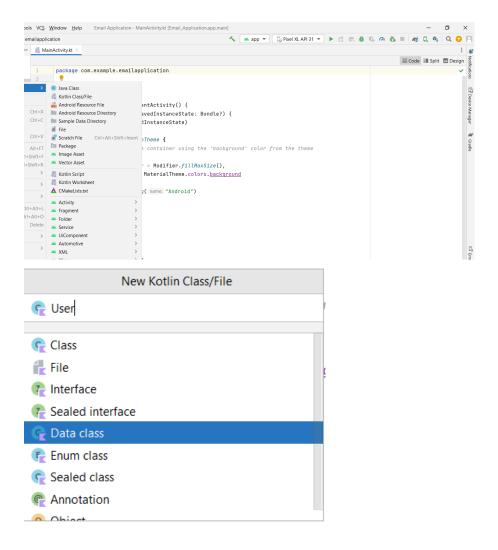

Task 4:

Creating the database classes.

In this project we will be having two databases, one is for user registration and login, and other is for admin to view the details of survey forms.

Database 1

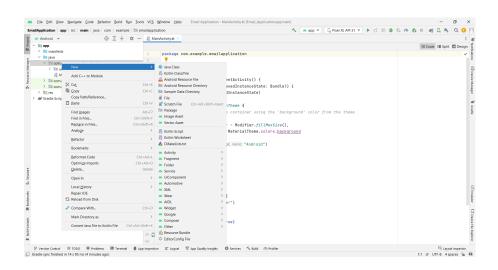

Step 1 : Create User data class

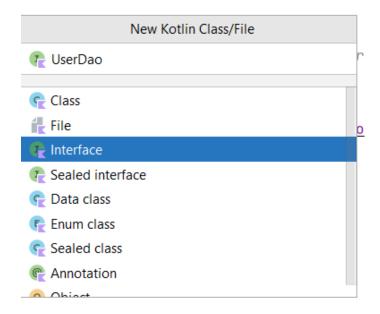

User data class code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/User.kt

Step 2: Create an UserDao interface

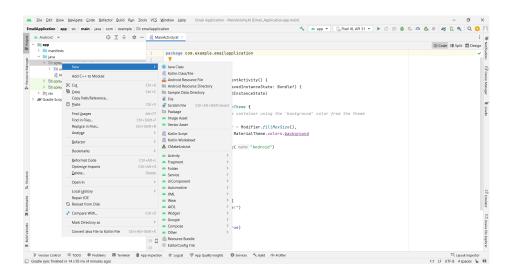

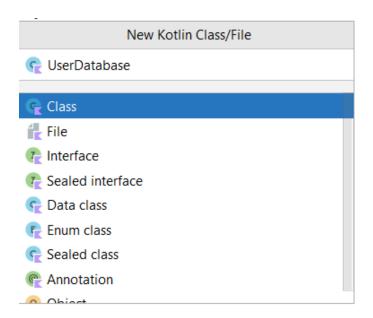

UserDao interface code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/UserDao.kt

Step 3: Create an UserDatabase class

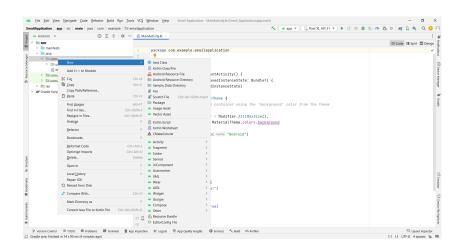

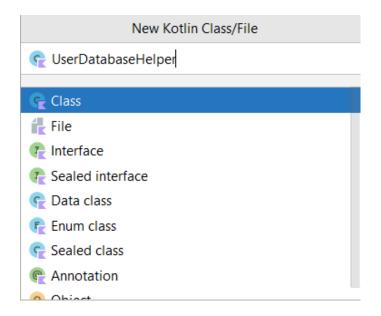

UserDatabase class code:

 $\frac{https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/co}{m/example/emailapplication/UserDatabase.kt}$

Step 4 : Create an UserDatabaseHelper class

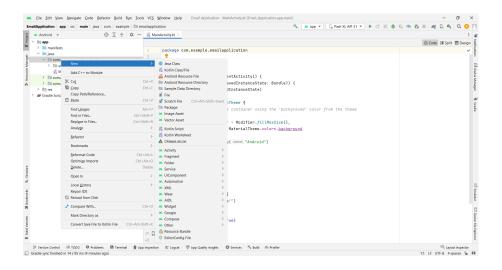

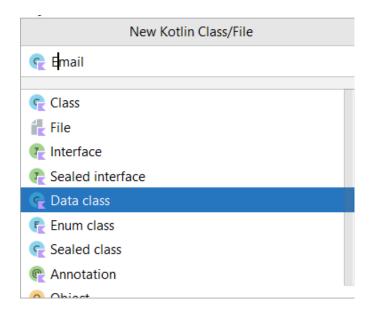

UserDatabaseHelper class code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/UserDatabaseHelper.kt

Database 2

Step 1 : Create Email data class

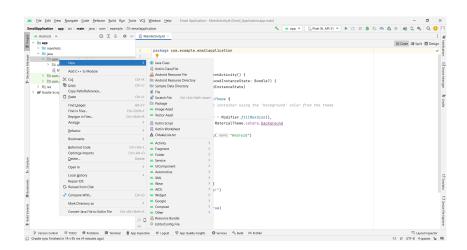

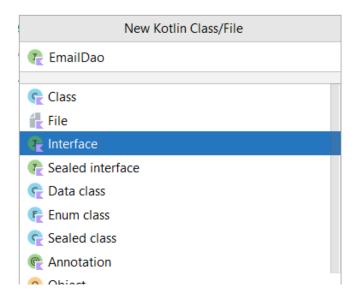

Email data class code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/Email.kt

Step 2 : Create EmailDao interface

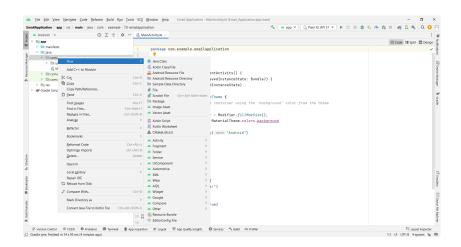

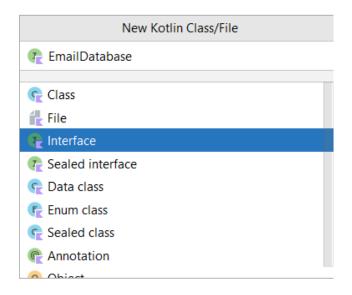

EmailDao interface code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/EmailDao.kt

Step 3 : Create EmailDatabase class

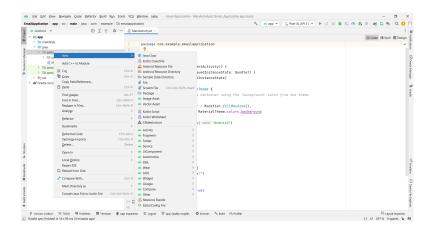

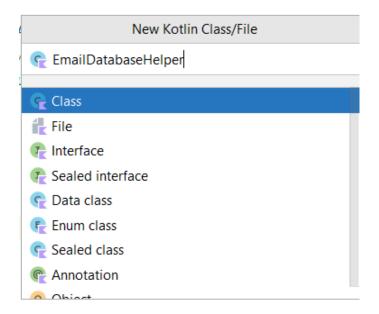

EmailDatabase class code:

 $\frac{https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/co}{m/example/emailapplication/EmailDatabase.kt}$

Step 4 : Create EmailDatabaseHelper class

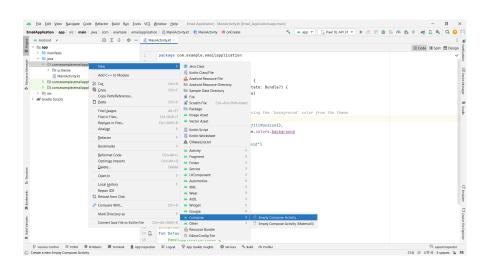

EmailDatabaseHelper class code:

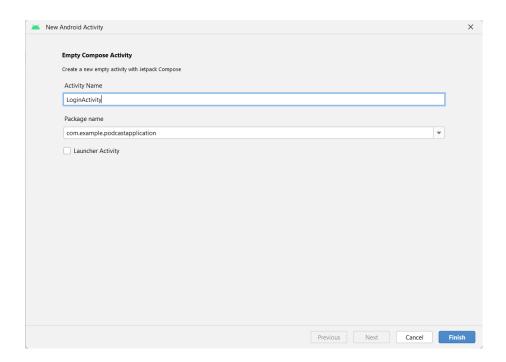

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/UserDatabaseHelper.kt

Task 5:

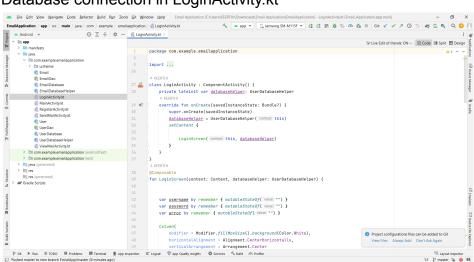

Building application UI and connecting to database.

Step 1: Creating LoginActivity.kt with database

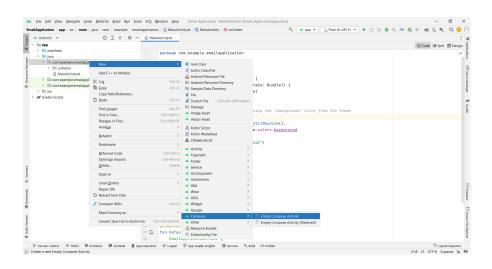

Database connection in LoginActivity.kt

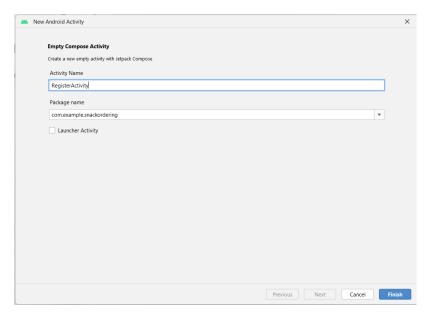

Complete code in below link:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/LoginActivity.kt

Step 2: Creating RegisterActivity.kt with database

Database connection in RegisterActivity.kt

```
Pube Edit of Storage Con.example.emailapplication
                         package com.

2
3 minport ...
26
             @Composable
fun RegistrationScreen(context: Context, databaseHelper: UserDatabaseHelper) {
                               var username by remember { mutobleStoteOf( whice "") }
var password by remember { mutobleStoteOf( value "") }
var email by remember { mutobleStoteOf( value "") }
var error by remember { mutobleStoteOf( value "") }
```

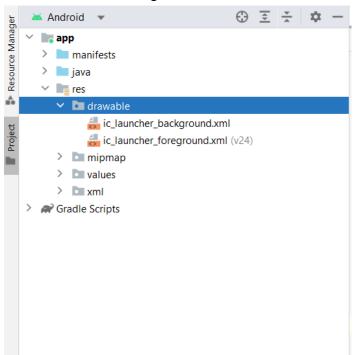

Complete code in below link:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/RegisterActivity.kt

Step 3: Creating MainActivity.kt file

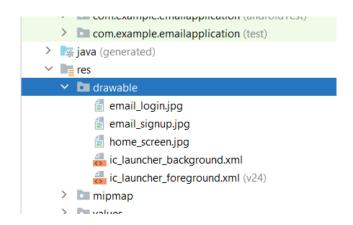

In MainActivity.kt file the main application is developed

• Before creating UI we need to add some images in drawables which are in res

Download the required drawable from the code:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/master/app/src/main/res/drawable

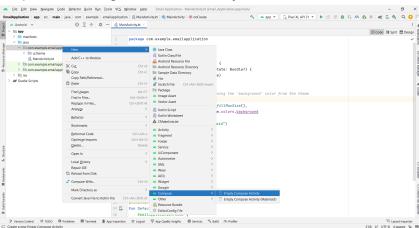

MainActivity.kt

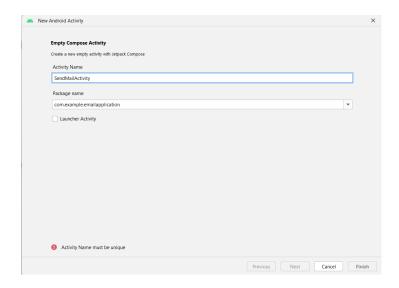

```
The first Yee Spronge Code Statute plat No. Took Of Mixture 1891 (Institutional Content of Management of Management 1894) (Institutional Content of Manage
```

Complete code in below link:

 $\frac{https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/co}{m/example/emailapplication/MainActivity.kt}$

Step 4 : Creating SendMailActivity.kt file

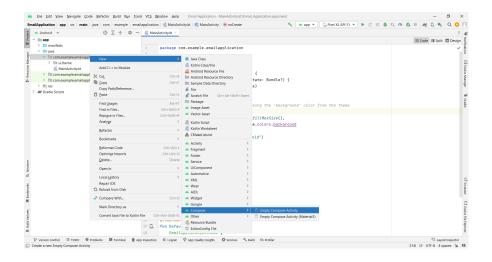

SendMailActivity.kt

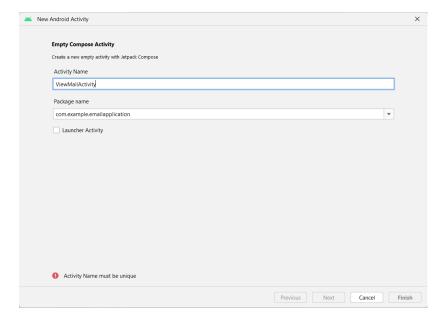

Complete code in below link:

https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/com/example/emailapplication/SendMailActivity.kt

Step 5: Creating ViewMailActivity.kt file

Complete code in below link:

 $\frac{https://github.com/smartinternz02/AdaptiveEmailApp/tree/main/app/src/main/java/co}{m/example/emailapplication/ViewMailActivity.kt}$

Task 6: Modifying AndroidManifest.xml

```
AndroidManifest.xml ×
      <?xml version="1.0" encoding="utf-8"?>
     <manifest xmlns:android="http://schemas.android.com/apk/res/android"</pre>
          xmlns:tools="http://schemas.android.com/tools" >
5
         <application
            android:allowBackup="true"
6
              android:dataExtractionRules="@xml/data_extraction_rules"
8
              android:fullBackupContent="@xml/backup_rules"
9 🕳
             android:icon="@mipmap/ic_launcher"
10
             android:label="Email Application"
             android:supportsRtl="true"
              android:theme="@style/Theme.EmailApplication"
              tools:targetApi="31" >
              <activity
                  android:name=".RegisterActivity"
                  android:exported="false"
16
                 android:label="RegisterActivity"
18
                 android:theme="@style/Theme.EmailApplication" />
19
             <activity
                android:name=".MainActivity"
                  android:exported="false"
                  android:label="MainActivity"
                  android:theme="@style/Theme.EmailApplication" />
```

When we run the app we will get the MainActivity.kt file as our first screen, but we want LoginActivity.kt, So we need to change in AndroidManifest.xml.

```
AndroidManifest.xml
                tools:targetApi="31" >
                   android:name=".RegisterActivity"
                    android:label="RegisterActivity"
                    android:theme="@style/Theme.EmailApplication" />
                   android:name=".MainActivity"
                   android:exported="false'
                    android:label="MainActivity"
                    android:theme="@style/Theme.EmailApplication" />
               <activity
                  android:name=".ViewMailActivity"
                    android:exported="false"
                    android:theme="@style/Theme.EmailApplication" />
                   android:name=".SendMailActivity"
                    android:exported="false"
                   android:label="SendMailActivity"
                    android:theme="@style/Theme.EmailApplication" />
                   android:name=".LoginActivity"
                    android:label="Email Application"
                    android:theme="@style/Theme.EmailApplication" >
                    <intent-filter>
                        <action android:name="android.intent.action.MAIN" />
  Text Merged Manifest
spection E Logcat $\Pi$ App Quality Insights $\Omega$ Services $\lambda$ Build $\Omega$ Profiler
```

Complete AndroidManifest.xml code:

https://github.com/smartinternz02/AdaptiveEmailApp/blob/master/app/src/main/AndroidManifest.xml

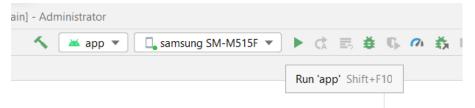

Task 7:

Running the application.

Step 1: Run apps on a hardware device

https://developer.android.com/studio/run/device

Step 2: Run the application in Mobile

Complete Project Link: https://github.com/smartinternz02/AdaptiveEmailApp

Final Output of the Application:
